

COMPUTER SOFTWARE

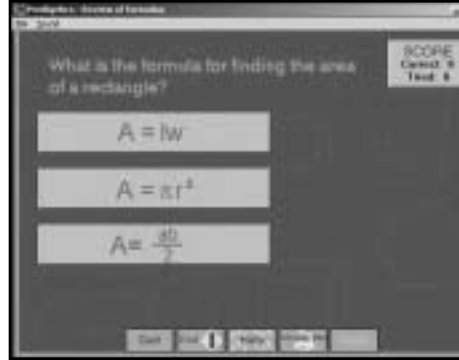

THE MATH CLASS

Grades 1-5

This program for primary and middle school students introduces most of the concepts presented in textbooks for these grades. Randomly selected numbers are used throughout the software, insuring that students will get a wide variety of problems. The problem solving sections of the units provide a review of the concepts taught in the unit, and give students a chance to apply what they have learned. Some of the concepts, such as Reading Tables, Reading Graphs, and Probability also present problem solving situations. The progress report helps you monitor your student's scores. The number of problems a student worked, the number answered correctly, and the percentage correct are displayed. If a concept has multiple levels, the highest level attained is also shown. The computer record sheet, included with the program provides a place for you to keep a written record of your students' current status as well as a list of all of the concepts found in the product. Program features include the hint box which appears for the first three problems in each section to help the student get off to a good start. The student can access a tutorial by clicking on the "show me" button at the beginning of any problem. The tutorial is not scored. The step-by-step mode is available in many sections. Full credit for a right answer is given if all the parts are correct. Positive feedback is always given with correct answers. If a student gets an incorrect answer, he may have the option of seeing the problem done correctly by clicking on the "show me" button. The first part covers whole number concepts, basic geometry, addition, subtraction, multiplication and division. The second part covers number concepts, fraction concepts, add and subtract fractions and decimals, multiply and divide fractions and decimals, and geometry and probability.

THE PRE-ALGEBRA CLASS

Grades 5-8

This interactive software is a comprehensive tutorial/practice program teaching the fundamental concepts students encounter in middle school and junior high math courses. Since visual and kinesthetic learners usually thrive on this method of instruction, the Pre-Algebra Class can enhance your math curriculum by providing concrete learning experiences, tutorials, as well as drill practice. The program reinforces fundamental math concepts required in algebra. This two-part software addresses a wide range of topics such as divisibility, rounding whole and decimal numbers, prime factors, basic addition review, basic subtraction review, estimating differences, problem solving, adding and subtracting fractions, basic multiplication review, basic division review, simplifying fractions, ratio and proportion, calculating interest, division and remainders, mental math, equivalent fractions, greatest common factor, least common multiple. Features such as the hint and example buttons guide learning and while the score box monitors progress. The Pre-Algebra Class provides a foundation that enables students to grasp the concepts needed by successful algebra students. It is a powerful tool that will aid in the development of your students' strong mathematical foundation.

THE ALGEBRA CLASS

Grades 7-10

This very popular program is a comprehensive interactive tutorial/practice of the fundamentals of algebra. It is particularly useful for visual-kinesthetic learners and those who enjoy independent learning. This software can be used in conjunction with any textbook to help students visualize concepts and to reinforce their skills. This software enables students to work in customized sequences that address their unique needs. The topics covered by this program are integers, solving equations, exponents, factoring, systems of equations, graphing, radicals, linear equations, combining like terms, absolute value, identifying points on a plane, writing inequalities, distributive property, evaluating expressions, multiplying binomials, writing expressions, writing equations, combining polynomials, second degree equations, dividing algebraic fractions, and the quadratic formula. The program is a proven tool that allows students to learn algebra concepts at their own pace with minimum adult intervention. It has been used by homeschooled students and in classrooms for a number of years. Features such as the hint and example buttons guide learning while the score box monitors progress in each concept. The progress report helps you monitor your students' scores. The number of problems a student worked, the number answered correctly, and the percentage correct are displayed.

THE GEOMETRY CLASS

Grades 8-12

This interactive computer program enables students to work at their own pace while receiving individualized instruction. Randomly selected numbers are used throughout the program, insuring that each student gets a wide variety of unique problems. This software is ideal for visual learners who often face difficulty in the traditional school setting. It helps students to work with a minimum of adult help/instruction. Features such as the hint and show me buttons guide learning, while the score box monitors progress. The progress report helps students, parents, and teachers monitor students' scores. The number of problems a student worked, the number answered correctly, and the percentage correct are displayed. Topics covered are lines and angles, solid figures, triangles, right triangles, plane figures, and coordinate geometry.
